

Screw conveyor

Introduction of the Screw conveyor

The screw conveyor is a kind of equipment that uses a motor to drive the screw to rotate and push the material to achieve the purpose of effective transportation. It can be used for horizontal, inclined, or vertical transport. With the advantage of simple engineering structure, it is widely used in food, medicine, chemical industry, plastics, and other industries. It is an effective conveying equipment, mainly used for conveying and vertical lifting of various powdery, granular, small block, and loose materials.
